CORE SAFETY
STAYS FREE

A factual guide to Garly, Last-Known Location, the AI companion, City Ambassadors and the optional Solana ecosystem.

VERSION 1.3 / 9 OCTOBER 2026

garlyapp.pro

01 / OVERVIEW

What Garly is today

Garly is an AI personal safety companion, available on iOS and Android. Preparation, optional monitoring and contact alerts sit alongside a companion that can remember what you choose to share.

Safety before subscriptions

Manual SOS, Protection Mode, Walk Mode, Live Journey, Last-Known Location, trusted contacts and saved places form the core safety experience. Core safety does not require Pro, a wallet, tokens or a particular evolution level.

Three parts, with clear boundaries

Part	Purpose
Personal safety	User-enabled checks, cancellable alert flows and sharing with selected trusted contacts.
AI companion	Conversation, optional memory, app context, personalities and seven visual evolutions.
Optional community	City Ambassadors and a separate Solana ecosystem. Participation does not buy stronger protection.

NEW IN THIS EDITION

Last-Known Location is live on both platforms. The companion has updated memory recall, app-state awareness and foreground follow-ups. Seven evolutions replace the previous nine-form presentation.

This document records the product on 9 October 2026. Store availability, permissions, regional restrictions and feature settings still apply. Pilot and planned systems are labelled separately.

02 / SAFETY FLOWS

Prepare. Check in. Reach out.

Garly gives people several ways to request help or configure an automatic alert. The AI conversation is separate from the safety machinery.

Manual SOS

Manual SOS starts a cancellable alert flow without requiring Protection Mode or waiting for the AI. Available contact channels and location permissions affect what can be delivered.

Protection Mode and stillness

When enabled, Protection Mode monitors supported, permitted device signals. Motion events and configured stillness checks can lead to a safety check and a cancellable countdown. If the configured flow completes without cancellation, Garly attempts to alert trusted contacts without another button press.

Walk Mode

Walk Mode is an explicitly started check-in timer. The user checks in to say they are present. A missed check-in can start the configured countdown and contact-alert flow. An ordinary chat reply is not a universal substitute for the safety confirmation control.

Live Journey

Live Journey shares a temporary location link with people the user chooses. Sharing can be stopped. The receiving page shows the available location and update information; a stale position is not proof of arrival or current safety.

DELIVERY IS AN ATTEMPT, NOT A GUARANTEE

General SOS flows can use configured Telegram, WhatsApp and email channels. Account linking, service availability, connectivity and recipient settings matter. No chat response should be treated as proof that an alert was delivered.

03 / LAST-KNOWN LOCATION

When the phone goes quiet

If an enabled phone stops checking in, Garly can notify selected contacts with the last position already saved on the server. The offline phone does not have to send a new message.

Step	What happens
1. Enable while online	Select eligible recipients and a threshold. Activation must be confirmed by the server.
2. Save updates	While the feature can run, the phone sends check-ins and available location updates.
3. Check the silence	The server checks elapsed time since the last phone update against the selected threshold.
4. Notify contacts	After the threshold is exceeded, the server attempts Telegram or email delivery with the saved position, its capture time and available accuracy.

YOUR THRESHOLD

Choose 10 minutes, 30 minutes, 1 hour or 2 hours. The default is 1 hour. A shorter threshold reacts sooner but may also flag ordinary interruptions more often.

The feature is opt-in. Pausing requires communication with the server; an offline local action is not a confirmed server cancellation. The feature retains the latest saved position, not a route history, with a 24-hour position retention limit.

The receiving contact needs a working delivery channel. Last-Known Location currently uses Telegram or email; do not assume every general SOS channel is available for this feature.

04 / LAST-KNOWN LOCATION

Useful evidence. Honest limits.

The feature reports a loss of phone updates. It does not detect an earthquake, collapse, landslide, assault or other specific emergency.

What it can help with

If a phone loses connectivity after an incident, the last uploaded position may give trusted contacts a useful starting point. Garly can send that saved information from the server while the phone remains offline. Its value depends on how recent and accurate the saved position is.

What can also trigger it

An empty battery, lost signal, force-closing the app, missing permissions or operating-system restrictions can interrupt check-ins. These situations are not proof of danger. Loss of GPS alone is different from loss of contact with the server.

What it cannot recover

Garly cannot upload a new position from a disconnected phone, reconstruct movements it never received, or guarantee that the saved point is where the person is now. Resumed connectivity does not itself establish that the person is safe.

TESTED, WITH CONTINUING WORK

Real-device checks on iPhone and Android confirmed receipt of a last-position message by the selected Telegram contact. Background update checks were also performed. These checks do not guarantee every device, network, permission state or future operating-system version.

Trusted contacts should interpret the timestamp and accuracy before acting. Garly is an additional source of information, not an emergency dispatch centre or a replacement for local emergency services.

05 / AI COMPANION

Memory with permission

Garly can use authorised profile details, selected memories, recent conversation and a limited snapshot of app state to make a conversation more useful.

Remember at the right moment

Relevant remembered details can be brought back into context instead of repeated indiscriminately. Routines and sensitive information require consent before persistent storage. Users can review or remove saved information and disable optional memory. A one-off change of plans is not automatically a permanent routine change.

Understand the app context

Context can include configured contacts and places, Protection, Walk Mode and Live Journey status, stillness checks, an SOS countdown and selected recent events. Garly can also explain the authenticated user's recorded evolution and the next milestone. It does not continuously see everything happening on the phone or read other apps.

Ask without escalating

With the app visible, eligible events or the usual end of a confirmed routine can prompt a brief question. Schedule checks use known routine days and the phone's timezone. They do not prove that the person followed that routine today or deviated from it.

A ROUTINE QUESTION IS NOT AN SOS

Ignoring a conversational follow-up does not notify contacts or start an SOS. Protection, stillness, Walk Mode and Last-Known Location retain their own separately configured safety rules.

The companion update passed local regression and deployment checks. Generated language remains model-dependent; naturalness, recall and judgement require ongoing evaluation.

06 / EVOLUTIONS

Seven ways to grow together

Evolution is visual progression, separate from personality and safety. It does not measure how much private information the AI actually knows.

Form	Character	Starting XP
Germy	Gentle, shy and curious	0
Plop	Affectionate, easygoing and a little clumsy	100
Boing	Energetic, playful and mischievous	250
Peep	Sensitive, thoughtful and tender	450
Wobble	Expressive, enthusiastic and adorably awkward	700
Orbit	A trio with adventurous, sleepy and happy moods	950
Oddity	Imaginative, observant and wonderfully peculiar	1,250

Progress through ordinary use

Each eligible activity earns 5 XP, with a shared daily maximum of 15 XP. A daily visit, Protection activation and Walk Mode activation each count at most once per day. One newly confirmed ordinary routine can count per day. The first five distinct trusted contacts and first five distinct saved places can each earn setup credit once per item.

Ordinary chat, repeated setup, SOS and dangerous or distressing situations do not earn progression rewards. Existing progress is carried into the seven-form system. Locked forms appear as silhouettes until unlocked.

Home evolution XP is separate from City Ambassadors mission XP and referral points. Token ownership and paid titles do not grant stronger emergency protection.

07 / PLANS AND PERSONALITY

Safety stays free

Garly Pro is an optional store subscription for the companion experience. It is not a requirement for core safety and is not a City Ambassador payment.

Free and Pro

Balanced is the Free conversation personality. Pro adds Professional, Friendly, Witty, Motivational, Minimal, Calm and Energetic, together with expanded saved memory, model choices, themes and personal usage insights. The current price, billing period and terms are shown in the store checkout.

Emoji may appear occasionally when the conversation and personality suit them. Professional and Minimal avoid them. Serious safety situations call for calm, clear language without jokes or decorative emoji, whichever personality is selected.

Memory and presentation

Free saved memory has a 60-item limit. Pro removes that item cap; this does not mean unlimited model context or perfect recall. Original mint is the standard look; Sakura Night and Moon Lake are Pro themes. Personal insights describe the account's own recorded usage.

THE PUBLISHED ICRC CONTRIBUTION

Garly's published policy allocates 30% of qualifying Pro charges to the International Committee of the Red Cross. The policy specifies refunds and chargebacks, the calculation basis and reporting cadence. Published transfer records, rather than an estimated counter, document payments actually sent.

Garly is a donor, not an ICRC partner, and the ICRC does not endorse the app. Store Pro revenue is distinct from the Ambassador vault. See garlyapp.pro/cause.html for the current policy and records.

08 / DATA AND DISTRIBUTION

Choice is part of the product

Garly handles sensitive safety context. Permissions, account separation and clear sharing controls matter as much as the interface.

User controls

Optional memory, Privacy Lock, parental controls, two-factor authentication and account export/deletion controls support user choice. Chats, memories, places, contacts and account-bound preferences must remain scoped to the authenticated account.

Processing and sharing

Chat may be processed by external AI providers. Garly does not claim that every operation happens on the phone or that all conversations are end-to-end encrypted. A private journey link can be viewed by its recipient and should not be posted publicly. Deleting a server-held position cannot recall copies of messages already delivered.

Public information and wallets

Private chats, contact lists, SOS details and personal location history are not intended to be written on-chain. An optional community map contribution is different from a private saved place. Garly never needs a wallet seed phrase or private key.

Availability and languages

Garly is available on the Apple App Store and Google Play. Store and regional availability can vary. The product offers 18 language options: English, Italian, Spanish, French, German, Portuguese, Brazilian Portuguese, Russian, Turkish, Arabic, Hindi, Telugu, Indonesian, Japanese, Korean, Chinese, Swedish and Persian, including Persian right-to-left layouts.

The formal privacy policy and terms remain the authoritative service documents. This English whitepaper is a product overview, not a replacement for those documents.

09 / TOKEN AND COMMUNITY

Optional participation on Solana

The consumer safety product works without a wallet. The community token, off-chain points and app subscriptions serve different purposes.

$GARLY

The project's community token is on Solana. City titles and Ambassador Premium use $GARLY payments. Holding a token is not a guarantee of benefits, token price, redemption value or future distributions.

OFFICIAL MINT

HNDFkPM2LgAMX6tK38ViwHWzmzuiQb6Kjqt4EHcMpump

Keep the balances separate

System	Meaning
Home evolution XP	Off-chain progression through seven companion forms. Not a token or a cash balance.
Community mission XP	The separate City Ambassadors participation system, used in community ranks and work calculations.
Referral / beta points	Off-chain records for eligible participation under the published campaign rules. Not guaranteed cryptocurrency rights.
Store Pro	An optional in-app subscription. It does not purchase a city or fund the shared $GARLY vault.

Referral campaigns and holder-linked benefits must be checked against their current published eligibility and activation status. This paper does not activate a campaign or promise a future token allocation.

10 / CITY AMBASSADORS

A role, not real-world ownership

City Ambassadors is an optional community programme. A city title is a role inside Garly, not ownership of a real city, property or an NFT.

Citizens join free

A citizen has one home city, a signed-in account and a saved Solana airdrop address. The published joining rules allow local entry within 400 km, entry through an invite, or worldwide entry to a city with Ambassador Premium. A 30-day move cooldown applies. Leaving resets the programme's community XP; this is separate from Home evolution progression.

Ambassadors acquire an available title

One account can hold one Ambassador city, and each city has one Ambassador. A vacant-title purchase sends $GARLY into the shared vault after on-chain payment verification. The title belongs to the Garly account. The original ticket is a payment, not tokens left staked in the paying wallet.

Participation and local information

Citizens contribute missions, shared map pins and checks. Ambassadors organise their city page and community. Roles and levels progress through participation and tenure. Community confirmations are not independent proof that a location is safe or dangerous.

SELLING AND RELEASING ARE DIFFERENT

Under the published rules, listing opens after the initial seven-day holding period. A sale requires a buyer; an app-calculated asking price is not a guaranteed market value. Sale proceeds go to the saved airdrop address. Releasing returns the title to the map; the original vault payment is not refunded.

11 / COMMUNITY ECONOMICS

The vault and Ambassador Premium

City payments and store subscriptions do not share a revenue system. This section describes the published programme rules; it does not promise a return.

Weekly allocation rules

The published weekly budget is 5% of the shared vault, capped so that at least 50% of cumulative city-ticket and Ambassador Premium buy-ins remains. Eligible city weights use work multiplied by tenure; ticket price is not the reward formula. The first seven days have zero tenure weight.

Work includes active citizens, danger reporters, twice the Ambassador's weekly mission XP, citizen weekly XP and invitee weekly XP. Tenure increases by 0.1 per full month held, up to 3.0. An idle city with zero work has zero weight. The weekly process produces a payout file for human execution, rather than guaranteeing an automatic transfer at a precise time.

Citizen shares and payout addresses

An Ambassador may share up to 50% of their weekly slice with participating citizens; the default is zero. Eligibility, dust and wallet rules apply. Rewards and sale proceeds use the Solana airdrop address saved in Hall. A connected paying wallet does not automatically replace that destination.

Ambassador Premium

The published option costs 1,000,000 $GARLY once, paid to the same vault. It adds worldwide joining, a public city photo reel and owner analytics for that city. It is separate from Garly Pro. Premium remains on the title after a sale; releasing the city disables it without returning the payment.

Any separate city-linked $GARLY revenue described by the programme is not store Pro revenue and is not the owner's Ambassador Premium buy-in. Consult the live manual for full rules and currently available payment routes.

12 / PILOT AND ROADMAP

Do not confuse plans with access

The following boundaries keep a live consumer product separate from experimental financial coordination and future ideas.

Garly Safety Pool: a pilot design

The existing Safety Pool concept is a private-circle USDC coordination pilot using Solana and Squads multisig. It is separate from the Ambassador $GARLY vault. The design uses official Circle USDC, member wallets and a configured operator approval threshold; it is not a custom Garly smart contract or a promise of automatic emergency funding.

Telegram can record a social approval or notification. It cannot by itself move funds. A withdrawal still requires the configured operators to sign and execute an on-chain transaction. The pilot design recommends 2-of-3 approval and no server-held wallet private key.

PILOT STATUS IS NOT GENERAL AVAILABILITY

This edition does not announce a public Safety Pool rollout or certify its security. End-to-end withdrawals, operator recovery, independent review and regional compliance remain prerequisites for broader use. Check actual product availability before relying on it.

Directions under evaluation

Further cosmetic choices, community initiatives and holder-linked access may be explored. None creates a present entitlement, guaranteed distribution, price target, yield, buy-back or redemption promise. New mechanisms need their own published rules before activation.

Product priorities

Reduce false alerts; validate background operation across more devices; improve model behaviour and consent-based recall; keep contact delivery and stale-location states understandable; and continue privacy and security review.

13 / SOURCES AND LIMITATIONS

A product record, not a promise

This edition supersedes version 1.2 of 9 September 2026. It updates platform availability, current safety features, the companion and evolutions while preserving the distinction between live, pilot and planned systems.

Basis and scope

Prepared from the current product implementation, public programme manual, contribution policy, prior pilot documentation and the October release checks. The public GitHub contains documentation and older selected native source snapshots; it is not a complete copy of the hosted web/API or current store builds.

SAFETY AND ECOSYSTEM LIMITATIONS

Garly does not replace emergency services, guarantee detection or rescue, or guarantee contact delivery. This whitepaper is product information, not investment advice, a securities offer or a promise of financial performance. Features and eligibility can change after testing, legal review or platform review.
